# Market-Based Approaches to Environmental Restoration

**April 20 ~ 12:30 to 1:45 p.m. ~ Hickerson House**  
*Bring your lunch / Drinks and dessert provided!*

**Martin Doyle**  
Associate Professor  
Department of Geography

Over the past 15 years, the United States has increasingly adopted market-based approaches to environmental management and restoration. These approaches, commonly in the form of compensatory mitigation, mitigation banking, or water quality trading, have generally received strong support from economists, and but less from ecologists. Dr. Doyle will discuss his work investigating the impact of market forces on mitigation location decisions, and the potential long-term signature of market-based restoration on the landscape.
